### I. INTRODUCTION

#### A. Ozone

Stratospheric ozone occurs naturally and is beneficial in the upper atmosphere, shielding the earth from harmful ultraviolet radiation from the sun. However, ground-level (tropospheric) ozone  $(O_3)$  is a colorless gas with a pungent, irritating odor and is a highly reactive harmful air pollutant that can damage living tissues and man-made materials upon contact.

O<sub>3</sub> is not directly emitted from sources, but formed in the air by reactions of ozone precursor emissions—volatile organic compounds (VOC) and oxides of nitrogen (NOx)—in the presence of sunlight and heat. Accordingly, peak O<sub>3</sub> levels occur during the sunnier, warmer times of the year, typically April through October.

The health effects of  $O_3$  are focused on the respiratory tract. When inhaled,  $O_3$  can irritate and inflame the lining of the lungs, much like sunburn damage on skin. Potential health impacts include aggravated asthma, reduced lung capacity, and increased susceptibility to respiratory illnesses like pneumonia and bronchitis. Individuals with respiratory problems are most vulnerable to  $O_3$ , but outdoor activities on "high"  $O_3$  days can even affect people that are normally healthy.

### B. Background

The Clean Air Act of 1970 (CAA) required the United States Environmental Protection Agency (EPA) to develop health-based National Ambient Air Quality Standards (NAAQS) for several categories of air pollutants, including O<sub>3</sub>. The CAA also requires EPA to periodically review the standards and associated scientific basis in determining appropriate revisions. Accordingly, EPA will establish new O<sub>3</sub> standards following advances in scientific understanding of the pollutant and its potential health effects.

Section 110 (a)(1) of the Federal Clean Air Act Amendments (FCAAA) of 1977 required EPA to divide the United States into "Planning Areas" and designate these areas "attainment", "nonattainment", or "unclassified" within 3 years of adopting the NAAQS.

The FCAAA of 1990 gave states the primary responsibility for achieving the NAAQS. The principal mechanism for complying with the FCAAA is developing and adopting a State Implementation Plan (SIP). A SIP outlines the programs, actions, and commitments a state will carry out to implement its responsibilities under the FCAAA. The EPA must approve all SIPs before they can be implemented by state and local governments. Once approved by the EPA, a SIP becomes a legally binding document under both state and federal law, and may be enforced by either government.

In 1990, EPA viewed all of Kern County as one "Planning Area" even though it was divided between two air basins. Unfortunately, there was not an  $O_3$  monitoring station located in Eastern Kern County at that time and the only data available was from the San

Joaquin Valley portion of Kern County. Consequently, all of Kern County was classified as Serious Nonattainment, with respect to the 1990 FCAAA. The statutory attainment date became November of 1999.

Table 1 below details the Ozone nonattainment classifications and mandatory attainment dates established in Section 181(a) of the FCAAA of 1990.

| Area Class | Ozone Design Value <sup>1</sup> | Primary Standard<br>Attainment Date <sup>2</sup> |
|------------|---------------------------------|--|
| Marginal   | 0.121 up to 0.138               | 3 years after enactment                          |
| Moderate   | 0.138 up to 0.160               | 6 years after enactment                          |
| Serious    | 0.160 up to 0.180               | 9 years after enactment                          |
| Severe     | 0.180 up to 0.280               | 15 years after enactment                         |
| Extreme    | 0.280 and above                 | 20 years after enactment                         |

Table 1, 1990 FCAAA

### C. Kern County Split

In 1992, Kern County was split between two air districts. The San Joaquin Valley portion of Kern County became part of the San Joaquin Valley Unified Air Pollution Control District (SJVUAPCD) and the Eastern Kern, high-desert portion of the County remained the Kern County Air Pollution Control District (KCAPCD)<sup>3</sup>. Even though the District is located in the Mojave Desert air basin, EPA continued to consider it part of the San Joaquin Valley Federal Ozone Planning Area. In November 2001, upon the District's request, EPA formally agreed to consider KCAPCD as a separate O<sub>3</sub> planning area.

### **D. 1994 Plan Requirements**

Section 182 (c) of the 1990 FCAAA prescribed requirements and schedules for attainment planning. In accordance the following three plans were required:

- 1. A minus 15% VOC Rate-of-Progress (ROP) Plan by November 15, 1993;
- A minus 3% Per Year VOC or NOx Reasonable Further Progress (RFP) Plan by November 15, 1994; and
- 3. An Attainment Plan by November 15, 1994.

KCAPCD prepared and submitted its ROP Plan by November 15, 1993 and submitted its RFP and Attainment Plans by November 15, 1994.

<sup>&</sup>lt;sup>1</sup> The design value is measured in parts per million (ppm).

<sup>&</sup>lt;sup>2</sup> The primary standard attainment date is measured from the date of the enactment of the Clean Air Amendments of 1990.

<sup>&</sup>lt;sup>3</sup> In 2010 KCAPCD appropriately changed its name to Eastern Kern Air Pollution Control District.

#### E. 1994 Attainment Plan

KCAPCD's 1994 Ozone Attainment Demonstration (Attainment Plan) was approved by EPA on September 25, 1996 (62 Fed. Reg. 1150, January 8, 1997). The Attainment Plan was presented in two parts: I (Transport Analysis) and II (Attainment Demonstration).

Part I showed KCAPCD is overwhelmingly impacted by O<sub>3</sub> transport from both the San Joaquin Valley Air Basin and the South Coast Air Basin. Eastern Kern air pollutant emission sources, by themselves, do not cause NAAQS or California Ambient Air Quality Standards (CAAQS) exceedances.

Part II showed KCAPCD would attain NAAQS but not CAAQS for  $O_3$  by 1999. This, in fact, did occur.  $O_3$  data collected from 1999-2002 at the District's  $O_3$  monitor located in Mojave showed attainment of the NAAQS.

| Ozone Data from 923 Poole Street (Mojave) Monitor |       |       |       |       |  |  |  |
|---|-------|-------|-------|-------|--|--|--|
| <b>Design Value Year:</b> 1999 2000 2001 2002     |       |       |       |       |  |  |  |
| Ozone ppm:  | 0.096 | 0.097 | 0.096 | 0.095 |  |  |  |

Table 2, District 1990 FCAAA Attainment

#### F. 1997 8-Hour NAAQS

An 8-hour  $O_3$  NAAQS was established in 1997 at a level of 0.08 ppm. The 8-hour averaging time was selected to address the impacts of exposure to longer periods of elevated  $O_3$  pollution. The standard is attained when: Each monitor in the region shows a three-year average, of the annual fourth-highest daily maximum 8-hour average  $O_3$  concentration, is no more than 0.084 ppm (based on the rounding convention dictated in federal regulation)<sup>4</sup>. Three years of  $O_3$  concentrations are averaged due to the impacts of year-to-year variations in meteorology on ozone formation.

In 2004, at request of the California Air Resources Board (CARB), EPA divided the District into two O<sub>3</sub> planning areas: The Indian Wells Valley (IWV), which attained the 1997 8-hour ozone NAAQS of 0.08 ppm, and the remainder of Eastern Kern County (Nonattainment Area). By 2011, the Design Value<sup>5</sup> of the District's Ozone Nonattainment Area dropped from 0.098 ppm (2003 level) to 0.080 ppm. On December 3, 2012, EPA announced they found that the Eastern Kern (Kern County APCD) nonattainment area attained the 1997 8-hour O<sub>3</sub> NAAQS.<sup>6</sup> With this finding, effective January 3, 2013, the entire District was deemed to have "clean data" with respect to the 1997 standard.

<sup>&</sup>lt;sup>4</sup> Appendix I to 40 CFR 50, "Interpretation of the Eight-Hour Primary and Secondary National Ambient Air Quality Standards for Ozone."

<sup>&</sup>lt;sup>5</sup>The three year average of the fourth highest 8-hour ozone value for the target year and the two preceding years is the design value for that year. To determine attainment that design value is compared to the Ozone NAAQS.

<sup>&</sup>lt;sup>6</sup> 77 Federal Register 71551-71555; December 3, 2012

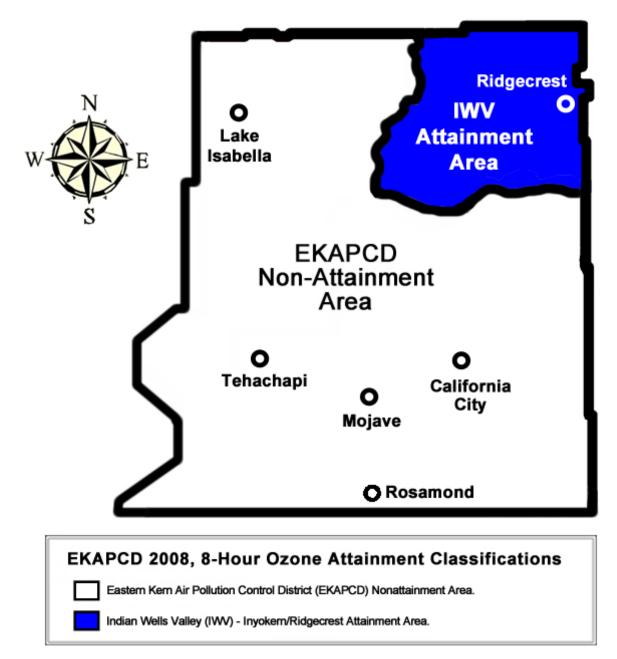

Figure 3: Indian Wells Valley Attainment Area

#### G. 2008 8-Hour Standard

In 2008, the EPA adopted a more stringent 8-hour Ozone NAAQS of 0.075 ppm<sup>7</sup>. Although the District showed a significant reduction in O<sub>3</sub> levels by attaining the 1997 Ozone NAAQS, and IWV<sup>8</sup> planning area met the new standard, the District's Design Value remained higher than the 2008 8-hour Ozone NAAQS.

In 2012, the District was classified as "Marginal" nonattainment pursuant to EPA's Final Rule for the 2008 8-hour Ozone NAAQS Air Quality Designations<sup>9</sup>. In 2016, EPA published Final Rule "Determinations of Attainment by the Attainment Date, Extensions of the Attainment Date, and Reclassification of Several Areas for the 2008 Ozone NAAQS<sup>10</sup>". In the Rule, EPA determined the District failed to meet the 2008 8-Hour Ozone NAAQS by the applicable attainment date of July 20, 2015. Therefore, under CAAA section 181(b)(2)(A), the District was reclassified by operation of law as "Moderate" nonattainment, effective June 3, 2016. As a result, the District is required to submit a SIP revision that meets the statutory and regulatory requirements applicable to the 2008, 8-Ozone NAAQS for the nonattainment area classified as "Moderate" by January 1, 2017.

Additionally, the District plans to request EPA reclassify the O<sub>3</sub> nonattainment area from moderate nonattainment to serious nonattainment because the District did not attain the 2008 8-Hour Ozone NAAQS by the appropriate deadline.

### II. DISTRICT NAME CHANGE

On May 13, 2010, the District's Governing Board formally changed the District's name to the Eastern Kern Air Pollution Control District. As a result, all references to Kern County Air Pollution Control District contained in documents dated March 20, 1991 (formation date of the San Joaquin Valley Unified Air Pollution Control District) or later, shall mean Eastern Kern Air Pollution Control District (District).

### **III. CHALLENGES**

### A. Geography

The District is located on the western edge of the Mojave Desert. This area is separated from populated valleys and coastal areas to the west and south by several mountain ranges. These valleys and coastal areas are the major source of  $O_3$  precursor emissions

<sup>&</sup>lt;sup>7</sup> 73 FR 16436; 40 CFR 50.15, "National Primary and Secondary Ambient Air Quality Standards for Ozone."

<sup>&</sup>lt;sup>8</sup> The Indian Wells Valley portion of Eastern Kern Air Pollution Control District was found attainment/unclassified for the 2008 Ozone NAAQS by EPA in 2011.

<sup>&</sup>lt;sup>9</sup> 77 Federal Register 30088; May 21, 2012

<sup>&</sup>lt;sup>10</sup> 81 Federal Register 26697; May 4, 2016

affecting O<sub>3</sub> exceedances within Eastern Kern's part of the Mojave Desert. Surrounding mountain ranges contain a limited number of passes serving as "transport corridors". These passes include Tehachapi Pass, connecting the western Mojave Desert to the southern San Joaquin Valley, and Soledad Pass and Cajon Pass connecting to the South Coast Air Basin. The Kern County portion of the western Mojave Desert is influenced primarily by transport through the Tehachapi Pass corridor with some potential influence through Soledad Pass. Soledad Pass and Cajon Pass mainly influence air quality in the eastern portion of the Mojave Desert due to prevailing wind directions.

### **B.** Pollutant Transport

It is common for pollutants to be transported between air basins, especially into a basin that is downwind. Transported pollutant significance on air quality in a downwind air basin depends on several factors. These include: Quantity of emissions in the upwind air basin compared to the downwind air basin; Prevailing wind direction; and Wind speed during times of high pollutant concentrations. Atmospheric chemistry and pollutant emissions in the downwind area also determine how transported pollutants affect downwind  $O_3$  concentrations.

Transported  $O_3$  and its precursors, VOCs and NOx, affect  $O_3$  concentrations in a downwind area. Transport from an upwind area to a downwind area occurs when winds are of sufficient magnitude, direction and duration. Transport can take place from the surface up to several thousand feet elevation.

### C. Meteorology

Meteorological data from several ambient air monitoring stations<sup>11</sup> and airports<sup>12</sup> located in Kern, Los Angeles, and San Bernardino Counties along with data obtained from ARB were analyzed. Data analysis revealed relative humidity in the desert to be very low in the summer with an average humidity below 10 percent during the hottest part of the day.

Temperatures can be in excess of  $100^{\circ}$  Fahrenheit for sixty to seventy days per year between the months of May and September with almost no rainfall. This combination of dry hot, clear days results in intense solar radiation, instrumental in formation of photochemical O<sub>3</sub>. Concurrence of these meteorological conditions are favorable to overwhelming transport of O<sub>3</sub> into the District<sup>13</sup>.

<sup>&</sup>lt;sup>11</sup> Ambient air monitoring data was collected at air monitoring stations in Mojave (Eastern Kern APCD), Bakersfield, Edison, Oildale, and Arvin (San Joaquin Valley APCD); Lancaster (South Coast AQMD), and Barstow and Trona (Mojave Desert AQMD).

<sup>&</sup>lt;sup>12</sup> Meteorological data came from the following airports: Mojave Airport, Edwards Air Force Base, Meadows Field, Naval Air Weapons Station, Lancaster, Ontario, San Bernardino, and Daggett.

<sup>&</sup>lt;sup>13</sup> The following components were analyzed: surface winds, winds aloft, estimated transport time, daily streamlines, surface airflow types, air parcel trajectories and daily maximum temperature.

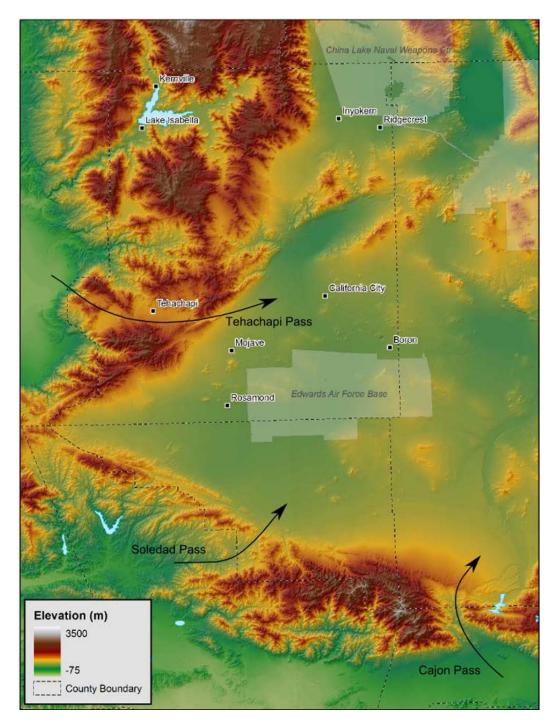

Figure 4: Transport Corridors Surrounding EKAPCD

### IV. RACT SIP REQUIREMENTS

Sections 182(b)(2) and 182(f) of the FCAAA (42 U.S.C. §7511(a)) require O<sub>3</sub> nonattainment areas to implement Reasonably Available Control Technology (RACT) emission standards for "major sources" of VOCs and NOx (O<sub>3</sub> precursors). RACT is also required for sources of air pollution that are subject to Control Techniques Guidelines (CTGs) issued by EPA<sup>14</sup>. RACT is defined as the lowest emissions limitation that a particular source is capable of meeting by the application of air pollution control technology that is reasonably available considering technological and economic feasibility (44 FR 53762; September 17, 1979).<sup>15</sup>

RACT requirements are included in the CAA to assure that significant source categories of O<sub>3</sub> precursor emissions are controlled to a "reasonable" extent, but not necessarily to the more stringent Best Available Control Technology (BACT) or Maximum Achievable Control Technology (MACT) levels expected for new or modified major stationary sources.

According to the EPA's Implementation of the 2008 Ozone NAAQS: SIP Requirements (80 FR 12263; March 6, 2015); Areas classified as moderate nonattainment or higher, must submit a demonstration that their current rules fulfill the 8-hour O<sub>3</sub> RACT for all CTG categories and all non-CTG major sources as a revision to their O<sub>3</sub> SIP.

On May 18, 2006, EPA released an official guidance document for preparing RACT SIPs titled: *Questions Related to RACT in 8-hour Ozone Implementation*. In addition, EPA Region 9 issued a basic framework to be used for a RACT SIP revision<sup>16</sup>. The framework notes a RACT SIP revision should contain the following information:

- Describe efforts to identify all source categories within the District requiring RACT, including CTG sources (i.e., covered by an EPA Control Technique Guideline document) and major non-CTG sources.
- Submit negative declarations where there are no facilities (major or minor) within the District subject to a CTG.
- For all categories needing RACT, list the state/local regulation that implements RACT. It may also be helpful to list the date EPA approved these regulations as fulfilling RACT.

<sup>&</sup>lt;sup>14</sup> CTGs are guidance documents that define RACT for existing sources of air pollution. Emission sources subject to CTGs are called CTG sources. RACT controls are also required on major VOC and NOx stationary sources not covered by CTGs. Such sources are called non-CTG sources.

<sup>&</sup>lt;sup>15</sup> RACT requirements are included in the Clean Air Act to ensure that significant source categories at major sources of ozone precursor emissions are controlled to a "reasonable" extent, but not necessarily to the more stringent best available control technology (BACT) or maximum achievable control technology (MACT) levels expected for new or modified major stationary sources.

<sup>&</sup>lt;sup>16</sup> The framework was contained in a March 9, 2006 letter from EPA Region 9 to California Air Resources Board (ARB)

- Describe the basis for concluding that the regulations fulfill RACT. Documents useful in establishing RACT include: CTGs, Alternative Control Technique guidance (ACTs), <sup>17</sup> MACT standards, New Source Performance Standards (NSPS), California Suggested Control Measures (SCM) and RACT/Best Available Retrofit Control Technology (BARCT) determinations, regulations adopted in other Districts, and guidance documents and rules developed by other state and local agencies.
- Some Districts may use CAPCOA's September 2003, *Potential All Feasible Measures (AFM) Report* to help demonstrate RACT. If so, the RACT SIP should certify that local regulations are equivalent to AFM, justify the assumption that the AFM fulfilled RACT in 2003, and include some sort of certification/ demonstration that no additional controls have become more reasonably available since then.

### V. DETERMINATION OF RACT AND FINDINGS

### A. CTG Source Categories

EPA issued CTGs defining RACT for existing facilities that emit air pollutants. District staff reviewed the list of CTG source categories and compared them to existing District Rules for applicable permitted sources.

Table 3 lists CTG source categories, reference documents, existence of affected sources in the District, and applicable District Rules. Existence of affected sources operating in the District was determined by District permit records, the emissions inventory database, and District permitting and enforcement staff.

Table 4 lists all applicable CTGs and associated District rules. Table 4 includes Rule adoption dates, amendment dates, and EPA Rule approval dates along with CTG applicability threshold/emission limits and District Rule applicability threshold/emission limits.

### **B. Non-CTG Major Sources**

Sources not subject to CTGs are referred to as non-CTG sources. RACT is required for non-CTG sources that collectively exceed the major source threshold at any permitted facility. As the District drafts an ozone SIP, that includes a request for re-designation to serious non-attainment, this RACT SIP is based on a major source threshold of 50 tons per year (tpy) of either VOCs or NOx because serious non-attainment areas have major source threshold of 50 tons per year (tpy) of either VOCs per year (tpy) of either VOCs or NOx because serious non-attainment areas have major source threshold of 50 tons per year (tpy) of either VOC or NOx. Therefore, District staff

<sup>&</sup>lt;sup>17</sup> CTG and ACT guidance documents can be found at: <u>https://www.epa.gov/ozone-pollution/control-techniques-guidelines-and-alternative-control-techniques-documents-reducing</u>.

examined non-CTG sources with a potential to emit (PTE) 50 tpy or more of either VOCs or NOx collectively at any individual facility.

Table 5 lists VOC and NOx emissions from all major sources located in District's nonattainment area. Table 5 includes each facility's name, subject emission unit permit number, process equipment name, pollutant, PTE, applicable District rules, and CTG source categories.

### C. Negative Declarations

District is required to submit negative declarations for CTG source categories that have no applicable sources operating within the District's nonattainment area. Table 6 lists CTG source categories with no applicable source located within the District's nonattainment area. CTGs listed in Table 6 constitute Negative Declarations for District's RACT SIP.

This is determined by review of District permit records, emissions inventory database, and District consulting with permitting and enforcement staff. The District determined one or more of the following situations exist for each CTG source category listed in Table 6:

- There are no sources located within the District's nonattainment area of the specified CTG source category; or
- There are no sources located within the District's nonattainment area with emissions exceeding the specific applicability threshold of the specified CTG source category.

### VI. RACT ANALYSIS

### A. Background

Emission sources covered by CTGs are known as CTG sources. The CAA<sup>18</sup> requires O<sub>3</sub> nonattainment areas to implement RACT for sources subject to CTGs issued for major sources of O<sub>3</sub> precursors. RACT requirements are included in the CAA to assure VOC and NOx emissions from major sources are controlled to a "reasonable" extent, but not necessarily to the more stringent BACT or "lowest achievable emission rate" (LAER) levels expected of new or modified major stationary sources.

CTG documents represent presumptive RACT levels of control for applicable sources of air pollution. The RACT SIP must contain adopted CTG-equivalent regulations for affected sources operating within the District's nonattainment area. Demonstration of existing regulations applicable to non-CTG major sources is appropriate for satisfying RACT when the cumulative PTE from a single source (facility) exceeds the nonattainment area's major source emission threshold. This RACT SIP is designed to demonstrate compliance with RACT requirements for major sources with a PTE 50-tpy or greater of VOCs or NOx. Negative declaration of CTG-equivalent rule necessity is required when there is no applicable source operating in the District's O<sub>3</sub> nonattainment area to which a CTG could apply, including sources located within the District's nonattainment area with emissions below the applicability threshold of the specified CTG source category.

District must provide notice and opportunity for public to comment on the draft RACT SIP, even where District certifies the existing regulation(s) satisfy RACT requirements, or where the District adopts a negative declaration. District must also submit appropriate supporting information for their RACT demonstrations. Once EPA approves the District's request to reclassify the O<sub>3</sub> nonattainment area to "Serious" nonattainment, attainment of the 2008, 8-hour O<sub>3</sub> NAAQS by the "moderate" attainment deadline of December 31, 2020, will not be feasible.

### **B. RACT Evaluations for CTG Sources**

The summaries below compare elements and emission limits in CTG documents to the corresponding elements of applicable District rules of the same source category. District rule elements are also compared to corresponding provisions of South Coast Air Quality Management District (SCAQMD) and San Joaquin Valley Unified Air Pollution Control District (SJVUAPCD) rules that regulate emissions from non-CTG major sources.

### RULE 410.3: ORGANIC SOLVENT DEGREASING OPERATIONS (Last Revised 5/7/1998)

Rule 410.3 reduces VOC emissions from solvent metal cleaning (degreasing) by specifying equipment/categories, their design requirements, and their operating practice requirements. Those three equipment/categories are cold cleaners, open top vapor degreasers, and conveyorized degreasers. The rule is essentially equivalent to CTG: Control of Volatile Organic

<sup>&</sup>lt;sup>18</sup> Section 182(b)(2) and 182(f) of the federal Clean Air Act (42 U.S.C. §7511a).

Emissions from Solvent Metal Cleaning. Therefore, Rule 410.3 meets RACT and does not require an update at this time.

### RULE 410.4: METAL, PLASTIC, AND PLEASURE CRAFT PARTS AND PRODUCTS COATING OPERATIONS (Last Revised 3/13/2014)

Rule 410.4 reduces VOC emissions by specifying VOC content limits in coatings used to coat metal parts and products, large appliances parts and products, metal furniture, plastic parts and products, automotive/transportation and business machines parts and products, and pleasure crafts, and from cleaning, storage, and disposal of organic solvents and waste solvent materials associated with such coating operations. For coating used for above operations, SCAQMD Rule 1107 (amended 1/6/2006) and SJVAPCD Rule 4603 (amended 9/17/2009) apply to similar sources as Rule 410.4. The coating with VOC content restrictions are mostly equivalent with Rule 410.4. Rule 410.4 has equivalent requirements to SCAQMD Rule 1107 and SJVAPCD Rule 4603; therefore, District Rule 410.4 meets RACT and does not require an update at this time.

### RULE 410.7: GRAPHIC ARTS (Last Revised 3/7/1996)

Rule 410.7 reduces VOC emissions from the use of inks, coatings, adhesives, and fountain solutions used at graphic arts printing operations through limiting VOC contents of inks, coatings, adhesives, and fountain solutions. There are no graphic arts printing facilities in the District that are equal to or exceed RACT applicability thresholds of 15 lb/day of total actual VOC emissions; therefore, Rule 410.7 is not required to meet RACT requirements.

#### <u>RULE 410.8: AEROSPACE ASSEMBLY AND COATING OPERATIONS (Last Revised</u> <u>3/13/2014)</u>

Rule 410.8 reduces VOC emissions from manufacturing, assembling, coating, masking, bonding, paint stripping, surface cleaning, service, and maintenance of aerospace components, and the cleanup of equipment, storage, and disposal of solvents and waste solvent materials associated with these operations. SCAQMD Rule 1124 (amended 9/21/2001) and SJVAPCD Rule 4605 (amended 6/16/2011) apply to sources similar to those subject to Rule 410.8.

Rule 410.8 limits the emissions of VOC from the application of coatings or adhesives on aerospace components. This rule contains limits on the VOC content of coatings, adhesives and cleaners used at aerospace component manufacturing operations. VOC contents limit requirements of this rule are equivalent to SCAQMD Rule 1124, Aerospace Assembly and Component Manufacturing Operations and SJVAPCD Rule 4605, Aerospace Assembly and Component Coating Operations, with a few variations in limits for specialty coatings and adhesives. Additionally, VOC content limits in Rule 410.8 are equivalent or more stringent to all corresponding VOC content limits in the CTG. Therefore, Rule 410.8 meets RACT requirements and no changes are required at this time.

# RULE 410.9: WOOD PRODUCTS SURFACE COATING OPERATIONS (Last Revised 3/13/2014)

Rule 410.9 reduces VOC emissions from wood products coatings and cleaning materials by limiting VOC content of the coats and by requiring certain application methods. Rule 410.9 has equivalent in VOC content limits for all wood product coats with SJVAPCD Rule 4606 (amended 10/16/2008). Rule 410.9 also has equivalent in VOC content limits to most coats from SCAQMD Rule 1136 (amended 6/4/1996) and more stringent to some coats from SCAQMD Rule 1136. Therefore, Rule 410.9 meets RACT and no changes are required at this time.

### RULE 412: GASOLINE TRANSFER INTO STATIONARY STORAGE CONTAINERS, DELIVERY VESSELS, AND BULK PLANTS (Last Revised 5/6/1991)

Rule 412 reduces VOC emissions from equipment used to transfer gasoline into stationary tanks, gasoline delivery vessels and gasoline bulk plants having a true vapor pressure of 1.5 psia or greater with a capacity of more than 250 gallons. California Air Resources Board (CARB) sets vapor recovery system standards and is responsible for certifying systems to meet those standards. California's local air districts have the primary authority for regulating gasoline dispensing facilities under vapor recovery rules. CARB implemented enhanced vapor recovery requirements during the 10 years starting in 2001 and vapor recovery systems are capable of recovering displaced gasoline vapors to an efficiency of ninety-five (95) percent or greater. Therefore, Rule 412 meets RACT and no changes are required at this time.

### RULE 412.1: TRANSFER OF GAS TO VEHICLE FUEL TANKS (Last Revised 11/9/1992)

Rule 412.1 reduces VOC emissions from transfer of gasoline into vehicle fuel tanks from stationary storage containers subject to the requirements of Rule 412 (Gasoline Transfer into Stationary Storage Containers, Delivery Vessels and Bulk Plants). A person shall not transfer or permit the transfer of gasoline from a stationary storage container into a motor vehicle fuel tank with a maximum capacity of more than five (5) gallons unless the gasoline dispensing unit is equipped with and has in correct operation a CARB-Certified Phase II Vapor Recovery System. California's local air districts have the primary authority for regulating gasoline dispensing facilities under vapor recovery rules. CARB enhanced vapor recovery systems are capable of recovering displaced gasoline vapors to an efficiency of ninety-five (95) percent or greater. Therefore, Rule 412.1 meets RACT and no changes are required at this time.

### C. RACT Evaluation for Non-CTG Major Sources

### RULE 425: COGENERATION GAS TURBINE ENGINES (Last Revised 8/16/1993)

Rule 425 was last adopted in August 16, 1993. Since then, the technology of reducing NOx emissions from gas turbine engines has advanced. Rule 425 is not as stringent as other California district rules such as San Diego Air Pollution Control District (SDAPCD) or Bay Area Air Quality Management District (BAAQMD). Therefore, the District is proposing to amend Rule 425 to correct RACT deficiencies.

# RULE 425.2: BOILERS, STEAM GENERATORS, AND PROCESS HEATERS (Last Amended 7/10/1997)

Rule 425.2 was last amended in July 10, 1997. Rule 425.2 requires NOx emission limits to be 70-ppmv for gaseous fuel and 115-ppmv for liquid fuel. These limits are referenced at dry stack gas conditions, adjusted to 3 percent by volume stack gas oxygen. District staff looked at SDAPCD Rule 69.2 and BAAQMD Rule 9-7. Both rules have NOx limits more stringent than Rule 425.2 and both rules proved to be able to satisfy RACT. Therefore, District is proposing to amend Rule 425.2 to correct RACT deficiencies.

### RULE 425.3: PORTLAND CEMENT KILNS (Last Adopted 10/13/1994)

Rule 425.3 was last adopted in October 13, 1994. Rule 425.3 requires NOx emission limits to be 6.4 pounds per ton of clinker produced when averaged over any 30 consecutive day period. The District was provided with similar rules that have more stringent NOx emission limits from other nonattainment areas that appeared to satisfy RACT. Therefore, District is proposing to amend Rule 425.3 to correct RACT deficiencies.

### **D. RACT SIP Evaluation Findings**

All rules applicable to CTG source categories were determined to meet or exceed CTG requirements. However, three District NOx rules applicable to non-CTG major sources were found to have deficiencies. The District will formally revise these rules to adequately correct their deficiencies and amend them to fulfill RACT requirements.

### E. Rule 210.1 (New and Modified Stationary Source Review) Revision

New and Modified Stationary Source Review (NSR), last amended May 4, 2000, is based on Serious nonattainment. Therefore, the Offset Emission Offset Ratio (1.2 to 1.0) and Offset threshold for NOx and VOC (greater than or equal to 25-tpy) listed in District Rule 210.1 do not need to be revised. However, EPA recently informed the District of out-of-date terms and definitions used in Rule 210.1. EPA is concerned these out-of-date terms and definitions could lead to potential deficiencies in the rule. EPA suggests the District revise Rule 210.1 to include updated language consistent with EPA requirements. The District is proposing to amend Rule 210.1 to comply with EPA's request.
